

Procedure for Offering Intraday Capacity Twice Daily at the Grebenyky, Kaushany, Oleksiivka and Ungheni Interconnection Points

This procedure establishes the operational framework for offering intraday capacity, in two daily sessions, via the Regional Booking Platform (RBP), at the Grebenyky, Kaushany, Oleksiivka and Ungheni interconnection points, operated by "Vestmoldtransgaz" LLC (VMTG).

The procedure regulates the method for calculating available intraday capacity, the steps for manual publication - twice daily - of capacity on the RBP, the allocation process, and the operational cooperation between VMTG and adjacent system operators.

1. General characteristics of the intraday capacity product:

- **Name:** Offering of intraday capacity
- **Duration:** Daily product
- **Capacity allocation procedure:** Auction
- **Auction platform:** RBP (Regional Booking Platform)
- **Product availability period:** Instrument 10, Instrument 15
- **Auction algorithm:** Uniform price algorithm
- **Entry/interconnection points covered:** Grebenyky, Kaushany, Oleksiivka and Ungheni
- **Restrictions:** For technical reasons, "Vestmoldtransgaz" LLC cannot offer intraday capacity products in compliance with the ENTSOG calendar.

2. Method for offering the capacity product

Publication frequency for VMTG:

VMTG will offer intraday capacity manually, in two daily sessions:

- **Instrument 10:** opening time 12:00, closing time 12:30 (Romania, Ukraine, Republic of Moldova time)
- **Instrument 15:** opening time 17:00, closing time 17:30 (Romania, Ukraine, Republic of Moldova time)

Determination of available intraday capacity:

The capacity to be offered within the intraday capacity auction is equal, for each hour, to:

A – C + D

where:

- **A** – the TSO's technical capacity for each standard capacity product

- **C** – previously sold technical capacity, adjusted to account for capacity re-offered in accordance with applicable congestion management procedures
- **D** – additional capacity, where applicable

Before the start of each auction, VMTG calculates the available capacity and publishes the firm intraday capacity offered after the closure of the last auction for the next day.

Publication of information on RBP:

The VMTG operator accesses the RBP platform, manually enters the data related to available capacity, verifies it, and publishes the information for the auctions under Instrument 10 and Instrument 15.

Booking process:

System users have the right to submit, withdraw, or modify bids from the opening of each auction round until its closure.

Each auction round lasts 30 minutes from its opening.

Capacity is allocated within 30 minutes after the closure of the auction round, provided that bids are accepted and the TSO completes the allocation process.

Auction results are made available simultaneously to individual system users.

Capacity nomination:

System users submit renomination requests in accordance with ANRE Decision No. 420/2019 approving the Network Code.

Reserve price in the auction:

The price of the intraday product is the one approved by ANRE through Decision No. 271 of 27 May 2025 and displayed on the RBP.

NOTE:

The natural gas transmission system operator of Romania, Transgaz and Gas TSO of Ukraine offer intraday capacity at interconnection points with the Republic of Moldova in accordance with the auction calendar published by ENTSOG.
